

**INDIAN SCHOOL AL WADI AL KABIR**

Mid-term Examination (2024-25)

**Sub: MATHEMATICS (041)**

Date: 19-09-2024

**Set 1**

Maximum marks: 80

Class: X

Time: 3 hours

**SECTION A**

Q.1.	(C) <del>any natural number</del> Any natural number	Q.11.	(D) mode
Q.2.	(B) $2^2 \times 5^2$	Q.12.	(B) isosceles triangle
Q.3.	(D) 7500	Q.13.	(D) 14
Q.4.	(D) 0	Q.14.	(A) $\frac{10}{3}$ cm
Q.5.	(C) coincident	Q.15.	(C) $x^2 - x - 12$
Q.6.	(B) 2:7	Q.16.	(D) $\frac{15}{4}$
Q.7.	(A) 2.5 cm	Q.17.	(A) $\frac{2}{3}$
Q.8.	(C) $\frac{\sqrt{1+\cot^2 \theta}}{\cot \theta}$	Q.18.	(B) 38
Q.9.	(B) 7	Q.19.	(a) Both Assertion (A) and Reason (R) are true and Reason (R) is the correct explanation of Assertion (A)
Q.10.	(A) increases by 2	Q.20.	(d) Assertion (A) is false, but reason (R) is true

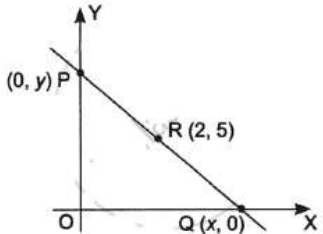

**SECTION B****This section comprises very short answer (VSA) type questions of 2 marks each**

Q.21.	(a) Show that $3 + 2\sqrt{5}$ is an irrational number if $\sqrt{5}$ is irrational .
-------	-------------------------------------------------------------------------------------

	<p>→ let take that <math>3 + 2\sqrt{5}</math> is rational number</p> <p>→ so, we can write this answer as</p> $\Rightarrow 3 + 2\sqrt{5} = \frac{a}{b}$ <p>Here a &amp; b use two coprime number and <math>b \neq 0</math>.</p> $\Rightarrow 2\sqrt{5} = \frac{a}{b} - 3$ $\Rightarrow 2\sqrt{5} = \frac{a - 3b}{b}$ $\therefore \sqrt{5} = \frac{a - 3b}{2b}$ <p>Here a and b are integer so <math>\frac{a - 3b}{2b}</math> is a rational number so <math>\sqrt{5}</math> should be rational number but <math>\sqrt{5}</math> is a irrational number so it is contradict</p> <p>- Hence <math>3 + 2\sqrt{5}</math> is irrational.</p>	<div style="border: 1px solid black; padding: 10px; margin: 10px;"> <math>\frac{1}{2} m</math>   <math>\frac{1}{2} m</math>   <math>\frac{1}{2} m</math>   <math>\frac{1}{2} m</math> </div>			
<b>OR</b>					
	<p>(b) Two neon lights are turned on at the same time. One blinks every 4 seconds and the other blinks every 6 seconds. In 120 seconds, how many times will they blink at the same time?</p> <p><math>4 = 2 \times 2</math> , <math>6 = 2 \times 3</math> ----- <math>\frac{1}{2} m</math></p> <p>Lcm = <math>2 \times 2 \times 3 = 12</math> ----- <math>1m</math></p> <p>In 60 sec , the number of times it blinks =5</p> <p>In 120 sec , the number of times it blinks =10 ----- <math>\frac{1}{2} m</math></p>				
<b>Q.22.</b>	<p>Given below are three linear equations. Two of them have infinitely many solutions and two have a unique solution. State the pairs: <math>4x - 5y = 3</math>, <math>8x - 10y = 6</math> and <math>5x - 4y = 5</math>. Show steps of comparison of ratios and state reason for the answer.</p> <table border="1" style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 33%; padding: 5px;"> <math>4x - 5y = 3</math>, <math>8x - 10y = 6</math>  <math>a_1/a_2 = \frac{1}{2}</math>, <math>b_1/b_2 = \frac{1}{2}</math>, <math>c_1/c_2 = \frac{1}{2}</math>  <math>a_1/a_2 = b_1/b_2 = c_1/c_2 = \frac{1}{2}</math>  They have infinitely many solution-  ------( 1 m) </td><td style="width: 33%; padding: 5px;"> <math>4x - 5y = 3</math>, <math>5x - 4y = 5</math>  <math>a_1/a_2 = 4/5</math> <math>b_1/b_2 = 5/4</math>  <math>a_1/a_2 \neq b_1/b_2</math>  They have unique solutions  ------( <math>\frac{1}{2} m</math>) </td><td style="width: 33%; padding: 5px;"> <math>8x - 10y = 6</math>, <math>5x - 4y = 5</math>  <math>a_1/a_2 = 8/5</math> <math>b_1/b_2 = 5/2</math>  <math>a_1/a_2 \neq b_1/b_2</math>  They have unique solutions  ------( <math>\frac{1}{2} m</math>) </td></tr> </table>		$4x - 5y = 3$ , $8x - 10y = 6$ $a_1/a_2 = \frac{1}{2}$ , $b_1/b_2 = \frac{1}{2}$ , $c_1/c_2 = \frac{1}{2}$ $a_1/a_2 = b_1/b_2 = c_1/c_2 = \frac{1}{2}$ They have infinitely many solution- ------( 1 m)	$4x - 5y = 3$ , $5x - 4y = 5$ $a_1/a_2 = 4/5$ $b_1/b_2 = 5/4$ $a_1/a_2 \neq b_1/b_2$ They have unique solutions ------( $\frac{1}{2} m$ )	$8x - 10y = 6$ , $5x - 4y = 5$ $a_1/a_2 = 8/5$ $b_1/b_2 = 5/2$ $a_1/a_2 \neq b_1/b_2$ They have unique solutions ------( $\frac{1}{2} m$ )

<b>Q.25.</b>	<p>A line intersects y-axis and x-axis at point P and Q, respectively. If R(2,5) is the mid-point of line segment PQ, then find the coordinates of P and Q.</p> <p>The coordinates of the mid-point of the line segment joining the point are  <math>[(x_1 + x_2)/2, (y_1 + y_2)/2]</math>          Consider the coordinates of P as (x, y) and Q as (x<sub>2</sub>, y<sub>2</sub>)          The midpoint of PQ = (2, -5)          Using the midpoint formula  <math>x = (x_1 + x_2)/2</math> and <math>y = (y_1 + y_2)/2</math>  <math>2 = (x_1 + x_2)/2</math> and <math>-5 = (y_1 + y_2)/2</math>          By cross multiplication  <math>x_1 + x_2 = 4</math>  <math>y_1 + y_2 = -10</math>          As the line PQ intersects the Y-axis at P  <math>x_1 = 0</math>          In the same way, <math>y_2 = 0</math>  <math>x_2 = 4</math> and <math>y_1 = -10</math>          So the coordinates of P is (0, -10) and Q is (4, 0).          Therefore, the coordinates of P and Q are (0, -10) and (4, 0).</p>	$\frac{1}{2}$ m  $\frac{1}{2}$ m  $\frac{1}{2}$ m  $\frac{1}{2}$ m

### SECTION C

**This section comprises of short answer (SA) type questions of 3 marks each.**

<b>Q.26.</b>	<p>Find the zeroes of the quadratic polynomial <math>5x^2 - 8x - 4</math> and verify the relationship between the zeroes and the coefficient of the polynomial.</p> <p>Let <math>f(x) = 5x^2 - 8x - 4</math></p> <p>By splitting the middle term, we get</p>		
--------------	--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	--	--

	$f(x) = 5x^2 - 10x + 2x - 4$ $= 5x(x - 2) + 2(x - 2)$ $= (5x + 2)(x - 2)$ <p>On putting <math>f(x) = 0</math> we get</p> $(5x + 2)(x - 2) = 0$ $\Rightarrow 5x + 2 = 0 \text{ or } x - 2 = 0$ $x = -2/5 \text{ or } x = 2$ <p>Thus, the zeroes of the given polynomial <math>5x^2 - 8x - 4</math> are <math>-2/5</math> and <math>2</math></p> <p><u>Verification</u></p> <p>Sum of zeroes = <math>\alpha + \beta = \frac{-2}{5} + 2</math></p> $= \frac{-2 + 10}{5} = \frac{8}{5} \text{ or }$ $= -\frac{\text{Coefficient of } x}{\text{Coefficient of } x^2} = -\frac{(-8)}{5} = \frac{8}{5}$ <p>Product of zeroes = <math>\alpha\beta = \frac{-2}{5} \times 2 = \frac{-4}{5} \text{ or }</math></p> $= \frac{\text{Constant term}}{\text{Coefficient of } x^2} = \frac{-4}{5}$ <p>Hence verified</p>	<div>½ m</div> <div>½ m</div> <div>½ m</div> <div>½ m</div> <div>½ m</div>
<b>Q.27.</b>	<p>(a) Solve for x and y :</p> $\frac{x}{2} + \frac{2y}{3} = -1 \text{ and } x - \frac{y}{3} = 3$	

Given system of equations are:  $\frac{x}{2} + \frac{2y}{3} = -1$  .....(1)

$$x - \frac{y}{3} = 3 \text{ .....(2)}$$

From eq 1 will have

$$\Rightarrow 3x + 4y = -6 \text{ .....(3)}$$

From eq 2 will have

$$\Rightarrow 3x - y = 9 \text{ .....(4)}$$

Now using elimination method first we will eliminate y :

now multiplying eq 4 from 4 will have

$$\Rightarrow 12x - 4y = 36$$

Now from eq 3 and 4 will get x:

$$3x + 4y = -6$$

$$12x - 4y = 36$$

$$\Rightarrow 15x = 30$$

$$\Rightarrow x = 2$$

Now substituting  $x=2$  in eq 2 will get y

$$\Rightarrow (2) 3 - y = 9$$

$$\Rightarrow 6 - y = 9$$

$$\Rightarrow -y = 9 - 6$$

$$\Rightarrow y = -3$$

$$\Rightarrow x = 2, y = -3$$

OR

(b) Solve for x and y :  $99x + 101y = 499$ ,

$$101x + 99y = 501$$

Given equation are

$$99x + 101y = 499 \text{ ---(1)}$$

$$101x + 99y = 501 \text{ ---(2)}$$

Adding (1) and (2)

$$200x + 200y = 1000$$

$$\therefore x + y = 5 \text{ ---(3)}$$

### SECTION D

This section comprises long answer (LA) type questions of 5 marks each.

<p><b>Q.32.</b> (a) A fraction becomes <math>\frac{9}{11}</math>, if 2 is added to both the numerator and the denominator. If, 3 is added to both the numerator and the denominator it becomes <math>\frac{5}{6}</math>. Find the fraction..</p> <p>Let the fraction <math>\frac{x}{y}</math>  According to given question,  <math>\frac{x+2}{y+2} = \frac{9}{11}</math>  <math>11(x+2) = 9(y+2)</math>  <math>11x + 22 = 9y + 18</math>  <math>11x - 9y + 22 - 18 = 0</math>  <math>11x - 9y + 4 = 0</math> ..... (1)  Again According to given question,  <math>\frac{x+3}{y+3} = \frac{5}{6}</math>  <math>6(x+3) = 5(y+3)</math>  <math>6x + 18 = 5y + 15</math>  <math>6x - 5y + 18 - 15 = 0</math>  <math>6x - 5y + 3 = 0</math> ..... (2)  Multiply (1) with 6 and (2) with 11  <math>66x - 54y = -24</math></p>	<div>½ m</div> <div>1 m</div> <div>½ m</div> <div>1 m</div>
---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------	-------------------------------------------------------------

$$66x - 55y = -33$$

$$y = 9$$

sub  $y=9$  in (2)

$$6x - 45 + 3 = 0$$

$$6x = 42$$

$$x = 7$$

Therefore fraction =  $\frac{7}{9}$

$1\frac{1}{2}$  m

$\frac{1}{2}$  m

**OR**

(b) Find the value of 'p' for which the quadratic equation

$$(p + 1)x^2 - 6(p + 1)x + 3(p + 9) = 0; p \neq -1 \text{ has real and equal roots.}$$

The given quadratic equation is  $(p + 1)x^2 - 6(p + 1)x + 3(p + 9) = 0; p \neq -1$

Compare given equation with the general form of quadratic equation, which  $ax^2 + bx + c$

$$a = (p + 1), b = -6(p + 1) \text{ and } c = 3(p + 9)$$

For equal roots,  $D = b^2 - 4ac = 0$

$$36(p + 1)^2 - 4(p + 1) \times 3(p + 9) = 0$$

$$\text{or, } 3(p^2 + 2p + 1) - (p + 1)(p + 9) = 0$$

$$\text{or, } 3p^2 + 6p + 3 - (p^2 + 9p + p + 9) = 0$$

$$\text{or, } 2p^2 - 4p - 6 = 0$$

$$\text{or, } p^2 - 2p - 3 = 0$$

$$\text{or, } p^2 - 3p + p - 3 = 0$$

$$\text{or, } p(p - 3) + 1(p - 3) = 0$$

$$\text{or, } (p - 3)(p + 1) = 0$$

$$\therefore p = -1, 3$$

$$\text{Neglecting } p \neq -1 \therefore p = 3$$

Now the equation becomes  $4x^2 - 24x + 36 = 0$

$$\text{or, } x^2 - 6x + 9 = 0$$

$$\text{or, } (x - 3)(x - 3) = 0$$

$$\therefore \text{ roots are } x = 3, 3$$

**Q.35.**

(a) The following table shows the ages of the patients admitted in the hospital during a year:

Age( in years)	5-15	15-25	25-35	35-45	45-55	55-65
Number of patients	6	11	21	23	14	5

Find the mode and mean of the data given above.

Mode: The class which have highest frequency.

In this case, class interval 35–45 is the modal class.

Now, Lower limit of modal class,  $l=35$ ,  $h=10$ ,  $f_1=23$ ,  $f_0=21$ ,  $f_2=14$ 

We know that,  $\text{Mode} = l + \left( \frac{f_1 - f_0}{2f_1 - f_0 - f_2} \right) \times h$

$$= 35 + \left( \frac{23 - 21}{2(23) - 21 - 14} \right) \times 10$$

$$= 35 + \left( \frac{2}{11} \right) \times 10 = 35 + 1.818 = 36.8$$

 $\frac{1}{2}$  m $1 \frac{1}{2}$  m

Age (in years)	Mid - value ( $x_i$ )	Frequency ( $f_i$ )	$u_i = \frac{x_i - 30}{10}$	$f_i u_i$
5 – 15	10	6	-2	-12
15 – 25	20	11	-1	-11
25 – 35	30	21	0	0
35 – 45	40	23	1	23
45 – 55	50	14	2	28
55 – 65	60	5	3	15
Total		80		43

Lets take assumed mean, A as 30

Class interval = 10

$$\therefore u_i = \frac{x_i - A}{h} = \frac{x_i - 30}{10}$$

$$\bar{x} = A + h \frac{\sum f_i u_i}{\sum f_i} = 30 + 10 \times \frac{43}{80}$$

$$= 30 + 5.375$$

$$= 35.375$$

$$\approx 35.37$$

(b) The median of the following data is 525. Find the values of x and y, if the total frequency is 100.

Class Interval	Frequency
0-100	2
100-200	5
200-300	x
300-400	12
400-500	17
500-600	20

600-700	y
700-800	9
800-900	7
900-1000	4

Class interval	Frequency (f)	Cumulative frequency (cf)
0-100	2	2
100-200	5	7
200-300	x	7+x
300-400	12	19+x
400-500	17	36+x
500-600	20	56+x
600-700	y	56+x+y
700-800	9	65+x+y
800-900	7	72+x+y
900-1000	4	76+x+y
		Total = 100

We have,

$$N = \sum f_i = 100$$

$$\Rightarrow 76 + x + y = 100 \Rightarrow x + y = 24$$

It is given that the median is 525. Clearly, it lies in the class 500 - 600

$$\therefore l = 500, h = 100, f = 20, F = 36 + x \text{ and } N = 100$$

Now,

$$\text{Median} = l + \frac{\frac{N}{2} - F}{f} \times h$$

$$\Rightarrow 525 = 500 + \frac{50 - (36 + x)}{20} \times 100$$

$$\Rightarrow 525 - 500 = (14 - x) \times 5$$

$$\Rightarrow 25 = 70 - 5x \Rightarrow 5x = 45 \Rightarrow x = 9$$

Putting  $x = 9$  in  $x + y = 24$ , we get  $y = 15$ .

Hence,  $x = 9$  and  $y = 15$ .

Q.38.

### Case Study- 3

Satellite image of a colony is shown below. In this view, a particular house is pointed out by a flag, which is situated at the point of intersection of x and y-axes. If we go 2 cm east and 3 cm north from the house, then we reach to a Grocery store. If we go 4 cm west and 6 cm south from the house, then we reach to an Electrician's shop. If we go 6 cm east and 8 cm south from the house, then we reach to a food cart. If we go 6 cm west and 8 cm north from the house, then we reach to a bus stand.

Based on the above information, answer the following questions.

(i)	Find the coordinates of grocery store, food cart and bus stand. Grocery =(2,3) food cart (6, -8) bus stand(-6,8) -----( 1 m )	1m
(ii)	(a) Find the distance between grocery store and food cart. Grocery =(2,3) food cart (6, -8) Distance formula ----- ( ½ m) Distance= $\sqrt{137}$ cm -----( 1 ½ m)  <b>OR</b>  (b) Find the distance of the bus stand from the house. bus stand(-6,8), House (0,0) Distance formula ----- ( ½ m) Distance = 10 cm -----( 1 ½ m)	2m  2m
(iii)	Find the ratio of distances of house from bus stand to food cart. bus stand(-6,8), House (0,0) food cart (6, -8) Distance formula -----( ½ m) Ratio = 1:1 -----( ½ m)	1m
