DIRECTION: In the question number 11 , 12 and 13, a statement of **assertion (A)** is followed by statement of **Reason (R)**. Choose the correct option.

(a) Both assertion (A) and reason (R) are true and reason (R) is the correct explanation of assertion (A)

(b) Both assertion (A) and reason (R) are true and reason (R) is not the correct explanation of assertion (A)

(c) Assertion (A) is true but reason (R) is false.

(d) Assertion (A) is false but reason (R) is true.

11. Assertion(A): PA and PB are tangents to the circle centred at O and $\angle OPA = 30^\circ$. Then, ΔPAB is an equilateral triangle.

Reason(R): Lengths of tangents from an external point to a circle are equal in length.

12. Assertion(A): A tangent to a circle is perpendicular to the radius through the point of contact.

Reason (R) : The lengths of tangents drawn from an external point to a circle are equal.

13. Assertion(A):If PA and PB are tangents drawn from an external point P to a circle with centre O, then the quadrilateral AOBP is cyclic.

Reason (R): The angle between two tangents drawn from an external point to a circle is supplementary to the angle subtended by the line segment joining the points of contact at the centre.
